MOTOROLA

MECL 10H SPICE Kit for Berkeley SPICE (PSPICE)

The purpose of this application note is to present spice parameters and schematics for a particular set of MC10H MECL logic devices. The devices to be presented are the:

MC10H101, H102, H103, H104, H105,H116,
H131, H188, H189, H210, and H211.

This file is intended for Berkeley SPICE Type simulators (e.g. PSPICE). A similar file is available for H–SPICE. Those are the most used simulators.

MC10H is a Motorola ECL family that features a 100% speed improvement over the standard 10K family, and still maintains the same gate power. The family has been designed with voltage compensation to keep both DC and AC parameters constant over a ±5% power supply variation, with a 75% improvement in noise margin as a result. The 10H family is a pin for pin duplicate of many of the MECL 10K devices, is compatible with 10K, MECL lll,and Motorola's new MC10E and MC10EL ECLinPS and E–Lite families.The devices, like all single supply ECL devices, are usable in a PECL (Positive Emitter Coupled Logic) mode and will suffer no AC or DC performance degradation if treated as prescribed in a Motorola Application Note "*Designing with PECL (ECL at +5.0V)*" (AN1406/D). AN1406 can be found in the new "*High Performance ECL Data Book*" (DL140/D) or it can be obtained through the Motorola Literature Distribution Center.

Family Specifications are located in the MECL DATA book DL122/D. Section 2 presents the temperature and power supply variations that can be expected from the family. The typical delay is 1.0ns, Tr/Tf is 1Ns, measured at the 20–80% points of the edges, Typical VOH is VCC–890MV, Typical VOL is VCC–1750MV, Typical VBB is VCC–1295MV, and 50 ohms to VTT (VCC–2.0v) is the max load recommended.

The following are netlists of the MC10H devices and will include the necessary typical resistor parasitics. The schematics of the netlist are included in the paper to allow the user the ease of seeing the function and follow the netlist more easily. There are no ESD models for the devices since the MC10H family has none.

The Global nodes will be:

(VCC)	Top rail power supply
(VCCO)	Top Rail Power supply for Emitter Follower Output Transistors
(VEE)	Bottom Rail Power Supply
(VBB)	Switching Bias Voltage (VCC–1295MV)
(VBBP)	Reference–Voltage (VCC–2095MV)
(VBBPP)	Reference–Voltage (VCC–2895MV)
(VCS)	Current Source Base Voltage (VEE + 1.3V)
(VTT)	Termination sink supply (VCC – 2.0V)
(IN)	Input
(INB)	Inverted input
(OR)	Or Output
(NOR)	Nor output
(CLK)	Clock Input
(CLKB)	Clock Bar Input

```
